What the code did.

1. Read the original CSV files: It loaded Parts 0001–0004, skipping Part 0005 because it contained duplicate records.
2. Selected relevant columns: It kept information such as purchase date, county, alcohol category, sales dollars, and sales volume.
3. Grouped similar records: For example, all sales of the same alcohol category in the same county could be grouped together.
4. Added the sales: It calculated total dollars, volume, and other available sales measurements for each group.
5. Saved five smaller CSV files: These are now in your Data/Processed Data folder.

2. Example of how the data changed

Original raw data

County	Alcohol category	Sales dollars
Polk	Vodka	$200
Polk	Whiskey	$150
Polk	Vodka	$300
Linn	Vodka	$100
Polk	Whiskey	$250

After processing

County	Alcohol category	Total sales
Polk	Vodka	$500
Polk	Whiskey	$400
Linn	Vodka	$100

Instead of keeping separate transactions, the program combines matching entries and adds their values together.

3. What each of your five processed CSV files does

Processed file	What it contains	Useful for
county_totals_2021.csv	Total sales for each county	Question 2
county_category_2021.csv	Total sales for each alcohol category within each county	Questions 1 and 2
daily_totals_2021.csv	Total statewide sales for each recorded date	Question 3
daily_category_2021.csv	Daily sales broken down by alcohol category	Questions 1 and 3
daily_county_category_2021.csv	Sales grouped by date, county, and alcohol category	All three questions
