Phase II Progress Report – Question 2

Question 2: County and Regional Liquor Sales

Our goal for Question 2 is to find which Iowa county had the highest liquor sales in 2021 and compare sales across different regions of the state.

Work Completed

We used the processed Iowa liquor sales dataset and separated the counties into five regions: Northwest, Northeast, Central, Southwest, and Southeast.

Using Python and Pandas, we wrote code to identify the county with the highest total sales and calculate the total and average sales per county in each region. We also created a bar graph to compare the regional averages.

Results and Findings

The code calculates which county had the highest liquor sales and shows how average county sales differ between regions.

The results and graph will help us understand which parts of Iowa have higher liquor sales.

Next Steps

We plan to review the results more closely and potentially use statistical testing to determine whether the differences between regions are significant.
